

Lift Note

**Sodium Hexametaphosphate. Pyridoxine hydrochloride. Menadione sodium bisulfate. Choline Chloride. Monohydrochloride.**

Dear Dog Lover,

Can you pronounce any of these words? Do you know what they are? They are just a few of the ingredients found in popular dog foods and treats sold in pet stores.

How about these: Red 40. Yellow 6. Yellow 5. Caramel Color. Corn Syrup. These are the artificial dyes and flavors those same foods and treats contain to make them look and taste good enough to feed to your dog.

Now try these: Beef. Lamb. Chicken. Sweet potatoes. Green beans.

These are some of the ingredients found in Puptastic Naturals, the dog treats that are made in people-quality kitchens with people-quality foods.

Ingredients you can pronounce. Whole foods. NO artificial dyes, preservatives or sweeteners.

You can pronounce them. You can eat them. You DO eat them. When dog foods are made with people-quality ingredients, they don't need artificial dyes and flavors to make them edible. They don't need chemical formulations to make them edible. Because they already ARE edible. And packed with nutrition.

The good folks at Furry Friends Natural Products plan to keep it that way by making dog foods and treats that are "people-quality but *pet-special*."

And that's why we at Hebron Parkway Veterinary Hospital recommend these foods and treats to our patients' canine companions. Because they are the most nutritionally sound foods on the market today.

In fact, we feed them to our own dogs at home.

If you are interested in feeding your dog like a true member of your family, you owe it to him to check out Puptastic Naturals. Compare them to the competition. Stack them up against the commercial "best" and you'll see (and your precious pup will taste) that they ARE the best.

For the love of your dog,

*Amanda Stokes*
